

Module 1 Activity 5: Control Structures

Purpose:

Explore the functionality of control structures.

Instructions:

Write a Python script for each of the following scenarios:

1. Write a script that accomplishes the following:
 - a. input command to ask the user the temperature today in degrees Celsius.
 - b. Convert this value to Fahrenheit
 - c. Print the result to the output.
2. Write a script that accomplishes the following:
 - a. Use three separate input commands to ask the user the year, month and day they were born.
 - b. Print a result to the output that appears as follows: "Your birthday is January 1, 1980"
3. Write a script that accomplishes the following:
 - a. Ask the user whether they celebrate their birthday or not using the input command.
 - b. Print a result to the output that appears as follows:
 - i. If they answered yes state: "May I wish you a belated birthday!"
 - ii. If they answered no state: "Does that mean I don't have to buy you a present?"
4. Write a script that accomplishes the following:
 - a. Ask the user what mark they would like to achieve in the course using the input command.
 - b. Print a result to the output that appears as follows:

- i. If the response was less than 50 state: “You should have higher expectations!”
- ii. Otherwise state: “Let’s try to get 100 percent!”
